

MagulaPlan — Live Demo Cheat Sheet & Spoken Walkthrough

Presenter: Maheen Sayuru (Project Manager / Full-Stack DevOps • CIT-24-02-0189) | **Total Time:** ~3 Minutes

PRE-DEMO SETUP (Do this 5 minutes before your viva):

- 1. Open in a background tab to wake up Render: <https://magulaplan-api.onrender.com/api/v1/vendor-categories>
- 2. Have ready in main tab: <https://magulaplan.infinityfreeapp.com/?i=1> (ensure you are logged out initially)
- 3. Demo Couple Account: `test@magulaplan.lk` | Password: `Password@123`

Part 1: Point-Wise Action & Talking Points (For Quick Glance)

Glance at the screen action, perform it with your mouse, and talk naturally using the bullet points.

Slide (~30 Seconds)

Engineer — 21.0% project share, 9 Jira tickets.
Structure (WBS), and governed Jira Kanban sprints.
pipelines on **InfinityFree** (frontend) and **Render** (Spring Boot backend).
aggregation API, the Guest RSVP status PATCH endpoint, and mobile Web

Part 2: Simplified Spoken Script (Natural Conversational English)

Read this script when practicing aloud. It is written in simple, everyday, fluent English so you can speak smoothly and naturally without memorizing complex jargon.

Slide 9: Your Individual Contribution

Good morning panel. I am Maheen Sayuru, the Project Manager and Full-Stack DevOps engineer for Group 04. My overall project share is 21%, covering 9 Jira tickets.

I was responsible for our Agile sprint planning, the Work Breakdown Structure, and managing our Kanban board in Jira. I set up our GitHub monorepo and created our automated cloud deployment pipelines on InfinityFree for our React frontend, and Render for our Spring Boot backend container.

On the backend, I built the budget summary API, the guest RSVP status update endpoint, and the mobile Web Share invitation feature. I also oversaw team integration to ensure all 31 Jira tickets were completed on time.

Live Demo Step 1: Landing Page

Panel, you are now looking at our live deployed website on InfinityFree, connected to our Spring Boot backend running on Render.

As you can see, our landing page is designed specifically for Sri Lankan weddings. Couples can easily browse our 8 core categories like venues, photographers, and caterers, or check out our handpicked luxury vendors like Cinnamon Grand Colombo and Studio 3000DF right on the front page.

Live Demo Step 2: Vendor Directory

Now let's go into the Vendor Directory. Notice how fast and smooth this is. I can search in real time for 'Studio', filter by district like 'Colombo', or pick a category like 'Photography'.

Our 25-district filter is a big advantage because couples can find vendors close to their ceremony location. Every vendor card clearly displays real starting prices in LKR, star ratings, and our verified checkmark badge. This solves the frustration of dealing with hidden pricing on social media.

Live Demo Step 3: Vendor Details & WhatsApp

Let's open Studio 3000DF. On this page, couples can see high-quality photos, package details, and contact information.

Notice our Web Share button: on mobile phones, it opens WhatsApp or Messages directly, while on desktop it copies the link. Even better, clicking 'Chat on WhatsApp' immediately creates a link with a ready-made message: 'Hello! I found your services on MagulaPlan and would like to inquire about packages.' The couple doesn't even need to type.

Live Demo Step 4: Cart & Booking Request

Couples don't book just one vendor; they plan their entire wedding. So we created this slide-over Cart Drawer. I will add Studio 3000DF and Lassana Flora to my selections. You can see the starting price subtotal right here.

When the couple clicks 'Request Bookings', it sends the checkout request to our backend. This creates confirmed pending bookings in our database, which automatically appear as new customer leads inside the vendors' portals.

Live Demo Step 5: Login & Couple Dashboard

Now let's sign in with our demo couple account. Thanks to our role-based routing, logging in as a couple takes us straight to the Couple Dashboard.

Right at the top, couples can see their live Nekath Wedding Countdown Timer ticking down every second to their big day. Below it are summary cards showing their budget items, guest count, and total estimated expenses.

Live Demo Step 6: Budget Tracker

Now let's check the Budget Tracker. This replaces messy Excel sheets. The Recharts pie chart gives a live visual breakdown of expenses across all wedding categories.

I can easily add a new expense, like 'Floral Arch' for 50,000 rupees. The totals and chart update instantly. And importantly for security, our backend enforces strict user isolation: couples can only view and edit their own budget items. No user can ever see another couple's private finances.

Live Demo Step 7: Guest List & Digital RSVP

Finally, let's look at the Guest List. Here, couples can organize guests by Bride or Groom family side and track banquet meal preferences.

When I click 'Share' on a guest like Nadeesha, the system generates a unique digital invitation link. We can send this directly over WhatsApp, and guests can RSVP right from their phones without creating an account.

Handover to Ruchira

That concludes the couple's wedding planning journey. I will now hand over to Ruchira, who will demonstrate our Commercial Vendor Portal, our plan tiers, the payment sandbox, and the Admin moderation dashboard. Thank you.

Part 3: Project Manager Quick Viva Answers

Keep these 4 short answers in mind if the examiners ask you direct project management questions:

Q: WBS & Jira Planning

A: We broke the project down into a formal 4-level WBS: Level 1 Project, Level 2 Subsystems, Level 3 Deliverables, and Level 4 Work Packages totaling 600 engineering hours. Every task mapped directly to one of our 31 Jira tickets.

Q: Budget & Savings

A: Our planned budget was LKR 861,500, and we completed it for LKR 720,000. That's a 16.4% savings, achieved by using free-tier cloud tools like InfinityFree, Render, Netlify, and Aiven MySQL.

Q: Why a Payment Sandbox?

A: Real merchant gateways like PayHere or Stripe require formal corporate business registration and fees, which are outside our student scope. To prove our commercial model, we built an interactive sandbox modal that simulates the transaction and upgrades vendor badges safely.

Q: DevOps & Reliability

A: Our React frontend is deployed on InfinityFree with an .htaccess rewrite rule for SPA routing. Our Spring Boot backend runs in a Docker container on Render with MySQL on Aiven Cloud. We added dynamic host detection so the site works automatically in any environment.
